PVCM curtain 800x1850

\r\n Frost-resistant PVC curtains are designed to reduce thermal inflows of air into the cold room, thus significantly improving the performance of cold rooms, reducing the load on refrigeration equipment and increasing its working life.\r\n \r\n The curtains are used where it is necessary to open and close the door of the refrigerating chamber frequently. Its application allows to save up to 50% of energy required to maintain the necessary temperature regime. The curtains also protect the chamber from dust and other external influences and provide excellent passability for personnel and warehouse equipment. \r\n \r\n The offered curtains are made of strips of frost-resistant PVC-film, a material with high indicators of durability and light transmission. The size of the strip is 2x200 mm.\r\n \r\n The minimum temperature at which the use of PVC curtains is recommended is -25°.

Technical specifications

Dimensions:	800x1850
Temperature range, °C:	-25

The manufacturer reserves the right to make changes that do not fundamentally affect the operational properties of the equipment without prior notice.
